

BATTLE OF NEIGHBORHOODS

By Amit Gupta

INTRODUCTION

The main aim of the project is to see which location is ideal to open a new restaurant in the city of Toronto. We have to keep in mind about various things such as competitors, population of the city and economical matters.

BUSINESS PROBLEM

Toronto is the provincial capital of Ontario and the most populous city in Canada, with a population of 2,731,571 in 2016. Current to 2016, the Toronto census metropolitan area (CMA), of which the majority is within the Greater Toronto Area (GTA), held a population of 5,928,040, making it Canada's most populous CMA. Toronto is the fastest growing city in North America, and is the anchor of an urban agglomeration, known as the Golden Horseshoe in Southern Ontario, located on the northwestern shore of Lake Ontario.

Target Audience: New business owners who want to open a new restaurant in the city of Toronto.

We need to recommend a good locality for new business owners and stakeholders to open a new restaurant.

DATA

For the analysis and the project, I will be using the data from **Wikipedia**. The Wikipedia page consists a **List of postal code of Canada: M**. This is a list of postal codes in Canada where the first letter is M. Postal codes beginning with M are located within the city of Toronto in the province of Ontario. Only the first three characters are listed, corresponding to the Forward Sortation Area. City of Toronto Neighbourhood Profiles use this Census data to provide a portrait of the demographic, social and economic characteristics of the people and households in each City of Toronto neighbourhood. Here is the link for the same:

► Link: https://en.wikipedia.org/wiki/List_of_postal_codes_of_Canada:_M

DATA

We will also be using **Foursquare data** to get information about restaurants in Toronto. For this we will be fetching the data using the foursquare api for which we will be needing the following details:

- 1) Client Id
- 2) Client Secret Key
- 3) Version
- 4) Latitude
- 5) Longitude
- 6) Radius
- 7) Limit

METHODOLOGY

The main aim of this project is to find the best location to open a new restaurant for new business owners and stakeholders. For this project, we have used "K-means clustering algorithm". K-means clustering is a type of unsupervised learning, which is used when you have unlabeled data (i.e., data without defined categories or groups). The goal of this algorithm is to find groups in the data, with the number of groups represented by the variable K. The algorithm works iteratively to assign each data point to one of K groups based on the features that are provided. Data points are clustered based on feature similarity.

ANALYSIS

For the analysis, we will be performing the following steps:

1. Data capturing and cleaning
2. Combining different data sets and getting latitude and longitude
3. Explore the neighborhoods
4. Clustering

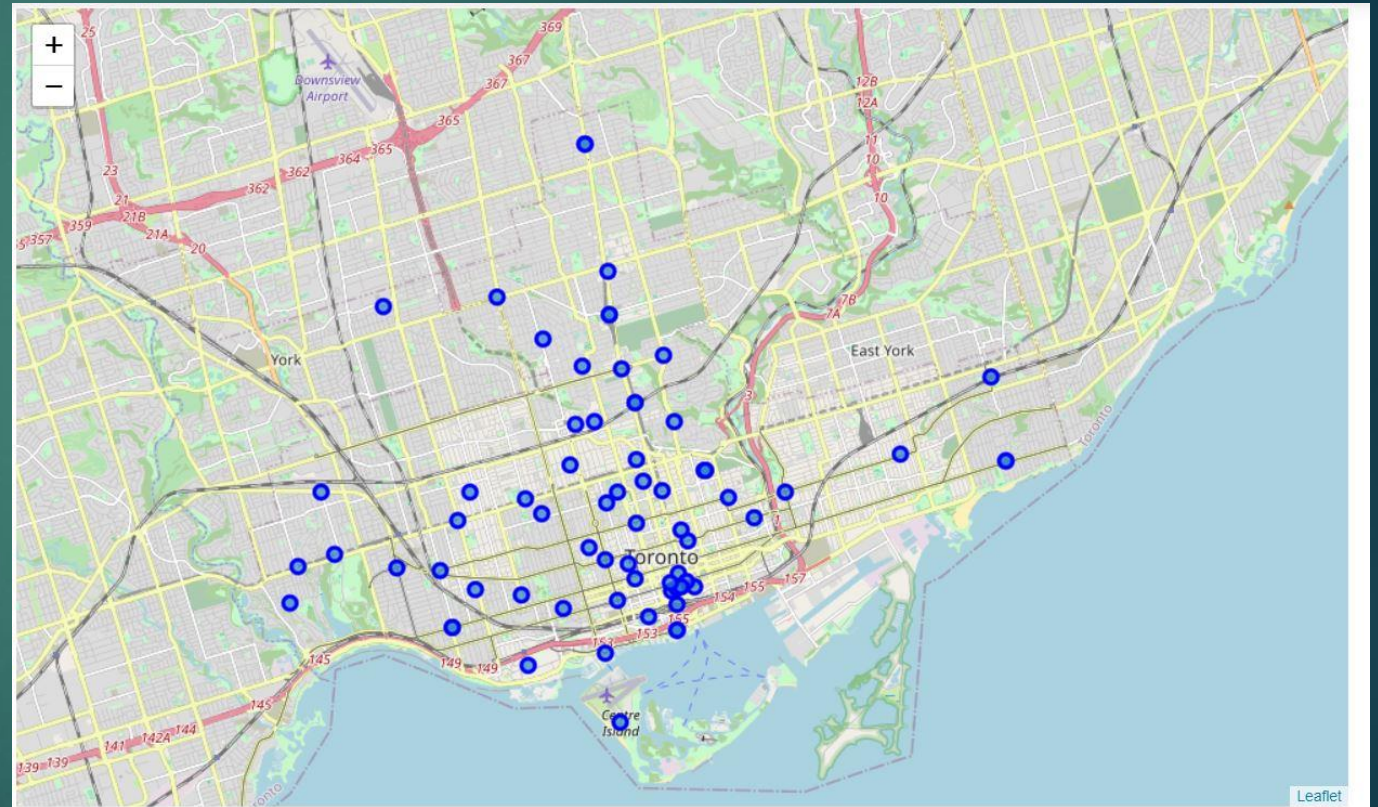

DATA CAPTURING AND CLEANING

| | Postal Code | Borough | Neighborhood | Latitude | Longitude |
|-----|-------------|------------------|----------------------|-----------|------------|
| 0 | M5A | Downtown Toronto | Regent Park | 43.660706 | -79.360457 |
| 1 | M5A | Downtown Toronto | Harbourfront | 43.640080 | -79.380150 |
| 2 | M7A | Downtown Toronto | Queen's Park | 43.659659 | -79.390340 |

RESULT AND DISCUSSION

Our analysis shows that although there is a great number of restaurants in Toronto, there are pockets of low restaurant density fairly close to city center. We have 4 boroughs and 78 neighborhoods inside geographical coordinate of 43.6534817, -79.3839347.

Based on our initial assumption of the cluster with maximum number of restaurants will have the best possibility to have a new restaurant due to the need in the area. Based on the resultant clusters it looks like Cluster 1 and Cluster 5 have higher number of restaurants than rest of the clusters.

CONCLUSION

The main aim of this project was to help new business owners and stakeholders to find an optimal location for opening a new restaurant. By calculating restaurant density distribution from Foursquare data we have first identified general boroughs that justify further analysis, and then generated extensive collection of locations which satisfy some basic requirements regarding existing nearby restaurants. Clustering of those locations was then performed in order to create major zones of interest.

Final decision on optimal restaurant location will be made by stakeholders and new business owners based on specific characteristics of neighborhoods and locations in every recommended zone.
